

Abstract

Interface to Axiom

Axiom is a free GPL-compatible (modified BSD license) general purpose computer algebra system whose development started in 1973 at IBM. It contains symbolic manipulation algorithms, as well as implementations of special functions, including elliptic functions and generalized hypergeometric functions. Moreover, Axiom has implementations of many functions relating to the invariant theory of the symmetric group S_n . For many links to Axiom documentation see

<http://wiki.axiom-developer.org>.

EXAMPLES: We evaluate a very simple expression in axiom.

```
sage: axiom('3 * 5')
15
```

Type: PositiveInteger

We factor $x^5 - y^5$ in Axiom in several different ways. The first way yields a Axiom object.

```
sage: F = axiom.factor('x^5 - y^5')
sage: type(F)
<class 'axiom.interfaces.axiom.AxiomElement'>
```

Note that Axiom objects are normally displayed using “ASCII art”; to see a normal linear representation of any Axiom object x , use `str(x)`. **no emph**

```
sage: F
          4      3      2 2      3      4
      - (y - x) (y + x y + x y + x y + x )
```

You can always use `x.str()` to obtain the linear representation of an object, even without changing the `display2d` flag. This can be useful for moving axiom data to other systems.

```
sage: F.str()
'-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)'
```

```
sage: axiom.display2d(False)
sage: F
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

The `axiom.eval` command evaluates an expression in axiom and returns the result as a string.

```
sage: print axiom.eval('factor(x^5 - y^5)')
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

`\end{verbatim}`

We can create the polynomial f as a Axiom polynomial, then call the `factor` method on it. Notice that the notation `f.factor()` is consistent with how the rest of `\sage` works.

`\begin{verbatim}`

```
sage: f = axiom('x^5 - y^5')
sage: f^2
(x^5 - y^5)^2
sage: f.factor()
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

Control-C interruption works well with the axiom interface, because of the excellent implementation of axiom. For example, try the following sum but with a much bigger range, and hit control-C.

```
sage: axiom('sum(1/x^2, x, 1, 10)')
1968329/1270080
```

0.1 Tutorial

We follow the tutorial at <http://wiki.axiom-developer.org/AxiomTutorial>.

```
sage: axiom('1/100 + 1/101')
201/10100
```

```
sage: a = axiom('(1 + sqrt(2))^5'); a
(sqrt(2) + 1)^5
sage: a.expand()
29*sqrt(2) + 41
```

```
sage: a = axiom('(1 + sqrt(2))^5')
sage: float(a)
82.012193308819747
sage: a.numer()
82.01219330881975
```

```
sage: axiom.eval('fpprec : 100')
'100'
sage: a.bfloat()
8.201219330881975641524897300208124427852048438593149412212371240173124187540110412666123
```

```
sage: axiom('100!')
93326215443944152681699238856266700490715968264381621468592963895217599993229915608941463
```

```
sage: f = axiom('(x + 3*y + x^2*y)^3')
sage: f.expand()
x^6*y^3 + 9*x^4*y^3 + 27*x^2*y^3 + 27*y^3 + 3*x^5*y^2 + 18*x^3*y^2 + 27*x*y^2 + 3*x^4*y +
sage: f.subst('x=5/z')
(5/z + 25*y/z^2 + 3*y)^3
sage: g = f.subst('x=5/z')
sage: h = g.ratsimp(); h
(27*y^3*z^6 + 135*y^2*z^5 + (675*y^3 + 225*y)*z^4 + (2250*y^2 + 125)*z^3 + (5625*y^3 + 18
+ 9375*y^2*z + 15625*y^3)/z^6
sage: h.factor()
(3*y*z^2 + 5*z + 25*y)^3/z^6
```

```
sage: eqn = axiom(['a+b*c=1', 'b-a*c=0', 'a+b=5'])
sage: s = eqn.solve(['a,b,c']); s
{\Tt{a} =\ (25*sqrt(79)*{\%}i\ +\ 25)/(6*sqrt(79)*{\%}i\ -\ 34),b\ =\ (5*sqrt(79)*{\%}i\
\ \ \ \ \ c\ =\ (sqrt(79)*{\%}i\ +\ 1)/10],\nwnewline
```

```

\\ \\ \\ \\ [a \\ =\\ (25*sqrt(79)*{\\%}i\\ -\\ 25)/(6*sqrt(79)*{\\%}i\\ +\\ 34),b \\ =\\ (5*sqrt(79)*{\\%}i\\
\\ \\ \\ \\ \\ c \\ =\\ -\\ (sqrt(79)*{\\%}i\\ -\\ 1)/10\\nwendquote}
\\end{verbatim}

```

Here is an example of solving an algebraic equation:

```

\\begin{verbatim}
sage: axiom('x^2+y^2=1').solve('y')
[y = -sqrt(1 - x^2),y = sqrt(1 - x^2)]
sage: axiom('x^2 + y^2 = (x^2 - y^2)/sqrt(x^2 + y^2)').solve('y')
[y = -sqrt((- y^2 - x^2)*sqrt(y^2 + x^2) + x^2),y = sqrt((- y^2 - x^2)*sqrt(y^2 + x^2)

```

You can even nicely typeset the solution in latex:

```

sage: latex(s)
\\left[ \\left[ a=\\frac{25 \\sqrt{79} i+25}{6 \\sqrt{79} i-34} , b= \\frac{5 \\sqrt{79} i+5}{6 \\sqrt{79} i-34} \\right] \\right]

```

To have the above appear onscreen via xdvi, type view(s).

(TODO: For OS X should create pdf output and use preview instead?)

```

sage: e = axiom('sin(u + v) * cos(u)^3'); e
cos(u)^3*sin(v + u)
sage: f = e.trigexpand(); f
cos(u)^3*(cos(u)*sin(v) + sin(u)*cos(v))
sage: f.trigreduce()
(sin(v + 4*u) + sin(v - 2*u))/8 + (3*sin(v + 2*u) + 3*sin(v))/8
sage: w = axiom('3 + k%i')
sage: f = w^2 + axiom('%e')^w
sage: f.realpart()
%e^3*cos(k) - k^2 + 9

sage: f = axiom('x^3 * %e^(k*x) * sin(w*x)'); f
x^3*e^(k*x)*sin(w*x)
sage: f.diff('x')
k*x^3*e^(k*x)*sin(w*x) + 3*x^2*e^(k*x)*sin(w*x) + w*x^3*e^(k*x)*cos(w*x)
sage: f.integrate('x')
(((k*w^6 + 3*k^3*w^4 + 3*k^5*w^2 + k^7)*x^3 + (3*w^6 + 3*k^2*w^4 - 3*k^4*w^2 - 3*k^6)*x^2 +
(3*k^3*w^3 + 3*k^5*w + k^7)*x + 3*k^6) * e^(k*x) * sin(w*x) / (k^2*w^2)

sage: f = axiom('1/x^2')
sage: f.integrate('x', 1, 'inf')
1
sage: g = axiom('f/sinh(k*x)^4')
sage: g.taylor('x', 0, 3)
f/(k^4*x^4) - 2*f/(3*k^2*x^2) + 11*f/45 - 62*k^2*f*x^2/945

sage: axiom.taylor('asin(x)', 'x', 0, 10)
x + x^3/6 + 3*x^5/40 + 5*x^7/112 + 35*x^9/1152

```

0.2 Examples involving matrices

We illustrate computing with the matrix whose i,j entry is i/j , for $i,j=1,\dots,4$.

```

sage: f = axiom.eval('f[i,j] := i/j')

```

```

sage: A = axiom('genmatrix(f,4,4)'); A
matrix([1,1/2,1/3,1/4],[2,1,2/3,1/2],[3,3/2,1,3/4],[4,2,4/3,1])
sage: A.determinant()
0
sage: A.echelon()
matrix([1,1/2,1/3,1/4],[0,0,0,0],[0,0,0,0],[0,0,0,0])
sage: A.eigenvalues()
{\Tt{0,4],[3,1\nwendquote}
sage: A.eigenvectors()
{\Tt{[0,4],[3,1\nwendquote},[1,0,0,-4],[0,1,0,-2],[0,0,1,-4/3],[1,2,3,4]]

```

We can also compute the echelon form in :

```

sage: B = matrix(QQ, A)
sage: B.echelon_form()
[ 1 1/2 1/3 1/4]
[ 0 0 0 0]
[ 0 0 0 0]
[ 0 0 0 0]
sage: B.charpoly().factor()
(x - 4) * x^3

```

0.3 Laplace Transforms

We illustrate Laplace transforms:

```

sage: _ = axiom.eval("f(t) := t*sin(t)")
sage: axiom("laplace(f(t),t,s)")
2*s/(s^2 + 1)^2

```

```

sage: axiom("laplace(delta(t-3),t,s)") #Dirac delta function
%e^-(3*s)

```

```

sage: _ = axiom.eval("f(t) == exp(t)*sin(t)")
sage: axiom("laplace(f(t),t,s)")
1/(s^2 - 2*s + 2)

```

```

sage: _ = axiom.eval("f(t) := t^5*exp(t)*sin(t)")
sage: axiom("laplace(f(t),t,s)")
360*(2*s - 2)/(s^2 - 2*s + 2)^4 - 480*(2*s - 2)^3/(s^2 - 2*s + 2)^5 + 120*(2*s - 2)^5/(s^
sage: axiom("laplace(f(t),t,s)")

```

$$\frac{360 (2 s - 2)}{(s^2 - 2 s + 2)^4} - \frac{480 (2 s - 2)^3}{(s^2 - 2 s + 2)^5} + \frac{120 (2 s - 2)^5}{(s^2 - 2 s + 2)^6}$$

```

sage: axiom("laplace(diff(x(t),t),t,s)")
s*laplace(x(t),t,s) - x(0)

```

```

sage: axiom("laplace(diff(x(t),t,2),t,s)")

```

```

-at('diff(x(t),t,1),t = 0) + s^2*laplace(x(t),t,s) - x(0)*s

sage.: axiom("laplace(diff(x(t),t,2),t,s)")
      !
      d      !      2
      -- (x(t))!      + s  laplace(x(t), t, s) - x(0) s
      dt      !
      !t = 0

```

Even better, use `view(axiom("laplace(diff(x(t),t,2),t,s")))` to see a typeset version.

0.4 Continued Fractions

A continued fraction $a + 1/(b + 1/(c + \dots))$ is represented in axiom by the list $[a, b, c, \dots]$.

```

sage: axiom("cf((1 + sqrt(5))/2)")
[1,1,1,1,2]
sage: axiom("cf ((1 + sqrt(341))/2)")
[9,1,2,1,2,1,17,1,2,1,2,1,17,1,2,1,2,1,17,2]

```

0.5 Special examples

In this section we illustrate calculations that would be awkward to do (as far as I know) in non-symbolic computer algebra systems like MAGMA or GAP.

We compute the gcd of $2x^{n+4} - x^{n+2}$ and $4x^{n+1} + 3x^n$ for arbitrary n .

```

sage: f = axiom('2*x^(n+4) - x^(n+2)')
sage: g = axiom('4*x^(n+1) + 3*x^n')
sage: f.gcd(g)
x^n

```

You can plot 3d graphs (via gnuplot):

```

sage.: axiom('plot3d(x^2-y^2, [x,-2,2], [y,-2,2], [grid,12,12])')
[displays a 3 dimensional graph]

```

You can formally evaluate sums (note the nusum command):

```

sage: S = axiom('nusum(exp(1+2*i/n),i,1,n)')
sage.: S

```

$$\frac{e^{2/n+3}}{e^{1/n}-1} \frac{e^{2/n+1}}{e^{1/n}+1}$$

We formally compute the limit as $n \rightarrow \infty$ of $2S/n$ as follows:

```

sage: T = S*axiom('2/n')
sage: T.tlimit('n','inf')
e^3 - e

```

0.6 Miscellaneous

Obtaining digits of π :

```
sage: axiom.eval('fpprec : 100')
'100'
sage: axiom(pi).bfloat()
3.141592653589793238462643383279502884197169399375105820974944592307816406286208998628034
```

Defining functions in axiom:

```
sage: axiom.eval('fun(a) == a^2')
'fun[a] := a^2'
sage: axiom('fun(10)')
100
```

0.7 Interactivity

Axiom has a non-interactive mode that is initiated via the command
")read file.input".

0.8 Latex Output

The latex output of Axiom is not perfect. E.g.,

```
sage: axiom.eval('tex(sin(u) + sinh(v^2))')
'$$\sinhv^2 + \sinu$$false'
```

Notice the lack of space after the sin macro, which is a latex syntax error. In this is automatically fixed via a substitution for trig functions, which may have potentially bad side effects:

```
sage: latex(axiom('sin(u) + sinh(v^2)'))
\sinh v^2+\sin u
```

It would be nice if somebody would fix this problem. One way would be to improve Axiom by making the fix to Axiom and giving this back to the Axiom people.

Here's another example:

```
sage: g = axiom('exp(3*i*x)/(6*i) + exp(i*x)/(2*i) + c')
sage: latex(g)
-\frac{i e^{3 i x}}{6}-\frac{i e^{i x}}{2}+c
```

0.9 Long Input

The Axiom interface reads in even very long input (using files) in a robust manner, as long as you are creating a new object.

Using axiom.eval for long input

is much less robust, and is not recommended.

```
sage: t = '"s"'%10^10000 # ten thousand character string.
sage: a = axiom(t)
```

A Sage Interface to Axiom

AUTHORS OF THIS MODULE: - William Stein (2006-10): Initial version based
October 13, 2025

`<axiom.py>≡`

```
r"""  
Interface to Axiom
```

```
Axiom is a free GPL-compatible (modified BSD license) general purpose  
computer algebra system whose development started in 1973 at IBM. It  
contains symbolic manipulation algorithms, as well as implementations  
of special functions, including elliptic functions and generalized  
hypergeometric functions. Moreover, Axiom has implementations of many  
functions relating to the invariant theory of the symmetric group  $S_n$ .  
For many links to Axiom documentation see  
\url{http://wiki.axiom-developer.org}.
```

AUTHORS OF THIS MODULE:

```
- William Stein (2006-10): Initial version based on Maxima interface  
- Bill Page (2006-10): Axiom version
```

```
If the string "error" (case insensitive) occurs in the output of  
anything from axiom, a RuntimeError exception is raised.
```

EXAMPLES:

```
We evaluate a very simple expression in axiom.
```

```
sage: axiom('3 * 5')
```

```
15
```

```
Type: PositiveInteger
```

```
We factor  $x^5 - y^5$  in Axiom in several different ways.
```

```
The first way yields a Axiom object.
```

```
sage: F = axiom.factor('x^5 - y^5')
```

```
sage: type(F)
```

```
<class 'axiom.interfaces.axiom.AxiomElement'>
```

```
Note that Axiom objects are normally displayed using 'ASCII art';  
to see a normal linear representation of any Axiom object x,  
use \code{str(x)}.
```

```
sage: F
4      3      2 2      3      4
-(y - x) (y + x y + x y + x y + x )
```

You can always use `x.str()` to obtain the linear representation of an object, even without changing the `display2d` flag. This can be useful for moving axiom data to other systems.

```
sage: F.str()
'-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)'
```

```
sage: axiom.display2d(False)
sage: F
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

The `axiom.eval` command evaluates an expression in axiom and returns the result as a string.

```
sage: print axiom.eval('factor(x^5 - y^5)')
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

We can create the polynomial f as a Axiom polynomial, then call the `factor` method on it. Notice that the notation `f.factor()` is consistent with how the rest of `sage` works.

```
sage: f = axiom('x^5 - y^5')
sage: f^2
(x^5 - y^5)^2
sage: f.factor()
-(y - x)*(y^4 + x*y^3 + x^2*y^2 + x^3*y + x^4)
```

Control-C interruption works well with the axiom interface, because of the excellent implementation of axiom. For example, try the following sum but with a much bigger range, and hit control-C.

```
sage: axiom('sum(1/x^2, x, 1, 10)')
1968329/1270080
```

`\subsection{Tutorial}`
 We follow the tutorial at
`\url{http://wiki.axiom-developer.org/AxiomTutorial}`.

```
sage: axiom('1/100 + 1/101')
201/10100
```

```
sage: a = axiom('(1 + sqrt(2))^5'); a
(sqrt(2) + 1)^5
```

```

sage: a.expand()
29*sqrt(2) + 41

sage: a = axiom('(1 + sqrt(2))^5')
sage: float(a)
82.012193308819747
sage: a.numer()
82.01219330881975

sage: axiom.eval('fpprec : 100')
'100'
sage: a.bfloat()
8.2012193308819756415248973002081244278520484385931494122123712401731241875401104...

sage: axiom('100!')
933262154439441526816992388562667004907159682643816214685929638952175999932299156...

sage: f = axiom('(x + 3*y + x^2*y)^3')
sage: f.expand()
x^6*y^3 + 9*x^4*y^3 + 27*x^2*y^3 + 27*y^3 + 3*x^5*y^2 + 18*x^3*y^2 + 27*x*y^2 + 3...
+ 9*x^2*y + x^3
sage: f.subst('x=5/z')
(5/z + 25*y/z^2 + 3*y)^3
sage: g = f.subst('x=5/z')
sage: h = g.ratsimp(); h
(27*y^3*z^6 + 135*y^2*z^5 + (675*y^3 + 225*y)*z^4 + (2250*y^2 + 125)*z^3 + (5625*y...
+ 9375*y^2*z + 15625*y^3)/z^6
sage: h.factor()
(3*y*z^2 + 5*z + 25*y)^3/z^6

sage: eqn = axiom(['a+b*c=1', 'b-a*c=0', 'a+b=5'])
sage: s = eqn.solve('a,b,c'); s
[[a = (25*sqrt(79)*%i + 25)/(6*sqrt(79)*%i - 34), b = (5*sqrt(79)*%i + 5)/(sqrt(79)...
11), c = (sqrt(79)*%i + 1)/10], [a = (25*sqrt(79)*%i - 25)/(6*sqrt(79)*%i + 34), b = ...
- 5)/(sqrt(79)*%i - 11), c = - (sqrt(79)*%i - 1)/10]]

Here is an example of solving an algebraic equation:
sage: axiom('x^2+y^2=1').solve('y')
[y = - sqrt(1 - x^2), y = sqrt(1 - x^2)]
sage: axiom('x^2 + y^2 = (x^2 - y^2)/sqrt(x^2 + y^2)').solve('y')
[y = - sqrt((- y^2 - x^2)*sqrt(y^2 + x^2) + x^2), y = sqrt((- y^2 - x^2)*sqrt(y...
+ x^2)]

You can even nicely typeset the solution in latex:
sage: latex(s)
\left[ \left[ a=\frac{25 \sqrt{79} i+25}{6 \sqrt{79} i-34} , b= \frac{5 \sqrt{79}

```

```

i+11} , c=\frac{\sqrt{79} i+1}{10} \right] , \left[ a=\frac{25 \sqrt{79} i-25}{i+34} , b= \frac{5 \sqrt{79} i-5}{\sqrt{79} i-11} , c=-\frac{\sqrt{79} i-1}{10} \right]

```

To have the above appear onscreen via `\code{xdvi}`, type `\code{view(s)}`.
 (TODO: For OS X should create pdf output and use preview instead?)

```

sage: e = axiom('sin(u + v) * cos(u)^3'); e
cos(u)^3*sin(v + u)
sage: f = e.trigexpand(); f
cos(u)^3*(cos(u)*sin(v) + sin(u)*cos(v))
sage: f.trigreduce()
(sin(v + 4*u) + sin(v - 2*u))/8 + (3*sin(v + 2*u) + 3*sin(v))/8
sage: w = axiom('3 + k*i')
sage: f = w^2 + axiom('%e')^w
sage: f.realpart()
%e^3*cos(k) - k^2 + 9

sage: f = axiom('x^3 * %e^(k*x) * sin(w*x)'); f
x^3*e^(k*x)*sin(w*x)
sage: f.diff('x')
k*x^3*e^(k*x)*sin(w*x) + 3*x^2*e^(k*x)*sin(w*x) + w*x^3*e^(k*x)*cos(w*x)
sage: f.integrate('x')
(((k*w^6 + 3*k^3*w^4 + 3*k^5*w^2 + k^7)*x^3 + (3*w^6 + 3*k^2*w^4 - 3*k^4*w^2 - 3*k^6)
+ (- 18*k*w^4 - 12*k^3*w^2 + 6*k^5)*x - 6*w^4 + 36*k^2*w^2 - 6*k^4)*%e^(k*x)*sin
(( - w^7 - 3*k^2*w^5 - 3*k^4*w^3 - k^6*w)*x^3 + (6*k*w^5 + 12*k^3*w^3 + 6*k^5*w)*x
- 12*k^2*w^3 - 18*k^4*w)*x - 24*k*w^3 + 24*k^3*w)*%e^(k*x)*cos(w*x))/(w^8 + 4*k^2
6*k^4*w^4 + 4*k^6*w^2 + k^8)

sage: f = axiom('1/x^2')
sage: f.integrate('x', 1, 'inf')
1
sage: g = axiom('f/sinh(k*x)^4')
sage: g.taylor('x', 0, 3)
f/(k^4*x^4) - 2*f/(3*k^2*x^2) + 11*f/45 - 62*k^2*f*x^2/945

sage: axiom.taylor('asin(x)', 'x', 0, 10)
x + x^3/6 + 3*x^5/40 + 5*x^7/112 + 35*x^9/1152

```

`\subsection{Examples involving matrices}`

We illustrate computing with the matrix whose i, j entry is i/j , for $i, j=1, \dots, 4$.

```

sage: f = axiom.eval('f[i,j] := i/j')
sage: A = axiom('genmatrix(f,4,4)'); A
matrix([1,1/2,1/3,1/4],[2,1,2/3,1/2],[3,3/2,1,3/4],[4,2,4/3,1])

```

```

sage: A.determinant()
0
sage: A.echelon()
matrix([1,1/2,1/3,1/4],[0,0,0,0],[0,0,0,0],[0,0,0,0])
sage: A.eigenvalues()
[[0,4],[3,1]]
sage: A.eigenvectors()
[[[0,4],[3,1]],[1,0,0,-4],[0,1,0,-2],[0,0,1,-4/3],[1,2,3,4]]

```

We can also compute the echelon form in \sage:

```

sage: B = matrix(QQ, A)
sage: B.echelon_form()
[ 1 1/2 1/3 1/4]
[ 0 0 0 0]
[ 0 0 0 0]
[ 0 0 0 0]
sage: B.charpoly().factor()
(x - 4) * x^3

```

\subsection{Laplace Transforms}

We illustrate Laplace transforms:

```

sage: _ = axiom.eval("f(t) := t*sin(t)")
sage: axiom("laplace(f(t),t,s)")
2*s/(s^2 + 1)^2

```

```

sage: axiom("laplace(delta(t-3),t,s)") #Dirac delta function
%e^-(3*s)

```

```

sage: _ = axiom.eval("f(t) == exp(t)*sin(t)")
sage: axiom("laplace(f(t),t,s)")
1/(s^2 - 2*s + 2)

```

```

sage: _ = axiom.eval("f(t) := t^5*exp(t)*sin(t)")
sage: axiom("laplace(f(t),t,s)")
360*(2*s - 2)/(s^2 - 2*s + 2)^4 - 480*(2*s - 2)^3/(s^2 - 2*s + 2)^5 + 120*(2*s - 2)
- 2*s + 2)^6

```

```

sage: axiom("laplace(f(t),t,s)")
3          5
360 (2 s - 2)  480 (2 s - 2)  120 (2 s - 2)
----- - ----- + -----
2          4          2          5          2          6
(s  - 2 s + 2)  (s  - 2 s + 2)  (s  - 2 s + 2)

```

```

sage: axiom("laplace(diff(x(t),t),t,s)")
s*laplace(x(t),t,s) - x(0)

```

```
sage: axiom("laplace(diff(x(t),t,2),t,s)")
-at('diff(x(t),t,1),t = 0) + s^2*laplace(x(t),t,s) - x(0)*s
```

```
sage.: axiom("laplace(diff(x(t),t,2),t,s)")
!
d      !      2
- -- (x(t))!      + s  laplace(x(t), t, s) - x(0) s
dt      !
!t = 0
```

Even better, use `\code{view(axiom("laplace(diff(x(t),t,2),t,s)"))}` to see a typeset version.

`\subsection{Continued Fractions}`

A continued fraction $a + 1/(b + 1/(c + \dots))$ is represented in axiom by the list $[a, b, c, \dots]$.

```
sage: axiom("cf((1 + sqrt(5))/2)")
[1,1,1,1,2]
sage: axiom("cf ((1 + sqrt(341))/2)")
[9,1,2,1,2,1,17,1,2,1,2,1,17,1,2,1,2,1,17,2]
```

`\subsection{Special examples}`

In this section we illustrate calculations that would be awkward to do (as far as I know) in non-symbolic computer algebra systems like MAGMA or GAP.

We compute the gcd of $2x^{n+4} - x^{n+2}$ and $4x^{n+1} + 3x^n$ for arbitrary n .

```
sage: f = axiom('2*x^(n+4) - x^(n+2)')
sage: g = axiom('4*x^(n+1) + 3*x^n')
sage: f.gcd(g)
x^n
```

You can plot 3d graphs (via gnuplot):

```
sage.: axiom('plot3d(x^2-y^2, [x,-2,2], [y,-2,2], [grid,12,12])')
[displays a 3 dimensional graph]
```

You can formally evaluate sums (note the `\code{nusum}` command):

```
sage: S = axiom('nusum(exp(1+2*i/n),i,1,n)')
sage.: S
```

$$\frac{e^{2/n+3}}{e^{2/n+1}} = \frac{e^{1/n} (e^{-1}) (e^{1/n} + 1)}{e^{1/n} (e^{-1}) (e^{1/n} + 1)}$$

We formally compute the limit as $n \rightarrow \infty$ of $e^{2/n}$ as follows:

```
sage: T = S*axiom('2/n')
sage: T.tlimit('n','inf')
%e^3 - %e
```

`\subsection{Miscellaneous}`

Obtaining digits of π :

```
sage: axiom.eval('fpprec : 100')
'100'
```

```
sage: axiom(pi).bfloat()
```

3.1415926535897932384626433832795028841971693993751058209749445923078164062862089

Defining functions in axiom:

```
sage: axiom.eval('fun(a) == a^2')
```

```
'fun[a] := a^2'
```

```
sage: axiom('fun(10)')
```

100

`\subsection{Interactivity}`

Axiom has a non-interactive mode that is initiated via the command `"read file.input"`.

`\subsection{Latex Output}`

The latex output of Axiom is not perfect. E.g.,

```
sage: axiom.eval('tex(sin(u) + sinh(v^2))')
```

```
'$$\sinh^2 + \sinu$$false'
```

Notice the lack of space after the `sin` macro, which is a latex syntax error. In `\sage` this is automatically fixed via a substitution for trig functions, which may have potentially bad side effects:

```
sage: latex(axiom('sin(u) + sinh(v^2)'))
```

```
\sinh v^2+\sin u
```

It would be nice if somebody would fix this problem. One way would be to improve Axiom by making the fix to Axiom and giving this back to the Axiom people.

Here's another example:

```
sage: g = axiom('exp(3*i*x)/(6*i) + exp(i*x)/(2*i) + c')
sage: latex(g)
-\frac{i e^{\{3 i x\}}{6}-\frac{i e^{\{i x\}}{2}+c
```

```
\subsection{Long Input}
```

The Axiom interface reads in even very long input (using files) in a robust manner, as long as you are creating a new object.

```
\note{Using \code{axiom.eval} for long input
is much less robust, and is not recommended.}
```

```
sage: t = "%s"%10^10000 # ten thousand character string.
sage: a = axiom(t)
"""
```

```

Return a numerical approximation to the integral of self from a to b.

INPUT:

var -- variable to integrate with respect to
a -- lower endpoint of integration
b -- upper endpoint of integration
desired_relative_error -- (default: '1e-8') the desired relative error
maximum_num_subintervals -- (default: 200) axiom number of subintervals

OUTPUT:

-- approximation to the integral
-- estimated absolute error of the approximation
-- the number of integrand evaluations
-- an error code:
0 -- no problems were encountered
1 -- too many subintervals were done
2 -- excessive roundoff error
3 -- extremely bad integrand behavior
4 -- failed to converge
5 -- integral is probably divergent or slowly convergent
6 -- the input is invalid

EXAMPLES:

```
sage: axiom('exp(-sqrt(x))').nintegral('x',0,1)
(0.5284822353142306, 4.1633141378838445E-11, 231, 0)
```

Note that GP also does numerical integration, and can do so to very high precision very quickly:

```
sage: gp('intnum(x=0,1,exp(-sqrt(x)))')
0.5284822353142307136179049194          # 32-bit
