The Wester Problem Set

Timothy Daly

March 26, 2013

Abstract

I'm starting to construct a document based on the Wester problem set (ref Wester, Michael J. (ed) "Computer Algebra Systems" Wiley 1999 ISBN 0-471-98353-5) that shows axiom in it's worst light. I've attached the proto-pamphlet. The idea is to focus on upgrading axiom to enhance the algebra. Eventually it is intended to be a "Can't Do" document of the kinds of algebra axiom still cannot do. A future effort wishlist.

Contents

1 Boolean Logic and Quantifier Elimination

```
-- Simplify logical expressions => false
true and false

   (1)  false
                                                              Type: Boolean
                                          Time: 0.03 (OT) + 0.02 (GC) = 0.05 sec
-- => true
x or (not x)

   Argument number 1 to "or" must be a Boolean.
x : Boolean

                                                               Type: Void
                                                              Time: 0 sec
x or (not x)

   x is declared as being in Boolean but has not been given a value.
-- => x or y
y : Boolean

                                                               Type: Void
                                                              Time: 0 sec
x or y or (x and y)

   x is declared as being in Boolean but has not been given a value.
-- => x
xor(xor(x, y), y)

   x is declared as being in Boolean but has not been given a value.
-- => [not (w and x)] or (y and z)
w : Boolean

                                                               Type: Void
                                                              Time: 0 sec
z : Boolean

                                                               Type: Void
                                                              Time: 0 sec
implies(w and x, y and z)
```

```
   w is declared as being in Boolean but has not been given a value.
-- => (x and y) or [not (x or y)]
--x iff y
-- => false
x and 1 > 2

   x is declared as being in Boolean but has not been given a value.

-- A linear system arising from the computation of a truncated power series
-- solution to a differential equation.  There are 189 equations to be solved
-- for 49 unknowns.  42 of the equations are repeats of other equations; many
-- others are trivial.  Solving this system directly by Gaussian elimination
-- is *not* a good idea.  Solving the easy equations first is probably a better
-- method.  The solution is actually rather simple.   [Stanly Steinberg]
-- => k1 = ... = k22 = k24 = k25 = k27 = ... = k30 = k32 = k33 = k35 = ...
--    = k38 = k40 = k41 = k44 = ... = k49 = 0, k23 = k31 = k39,
--    k34 = b/a k26, k42 = c/a k26, {k23, k26, k43} are arbitrary

   Your expression cannot be fully compiled because it contains an
      integer expression (for - ) whose sign cannot be determined (in
      general) and so must be specified by you. Perhaps you can try
      substituting something like
```

```
                                  (- :: PI)
                                     or
                                 (- :: NNI)
      into your expression for - .
   AXIOM will attempt to step through and interpret the code.

         + cos(t)   sin(t)+

   AXIOM will attempt to step through and interpret the code.

   Anonymous user functions created with +-> that are processed in
      interpret-code mode must have result target information
      available. This information is not present so AXIOM cannot
      proceed any further. This may be remedied by declaring the
      function.
